

## ABSTRACT

1 An electrical compression connector including a first  
2 section having a first conductor receiving channel  
3 extending into a top side of the connector; and a second  
4 section integrally formed with the first section. The  
5 second section has a second and a third conductor  
6 receiving channel extending into opposite respective  
7 second and third lateral sides of the connector. The  
8 second conductor receiving channel has opposing concave  
9 surfaces having different shapes.
